

Can ferroelectric crystals increase photovoltaic effect?

The photovoltaic effect of ferroelectric crystals can be increased by a factor of 1,000 if three different materials are arranged periodically in a lattice. Researchers achieved this by creating crystalline layers of barium titanate, strontium titanate and calcium titanate which they alternately placed on top of one another.

Can a ferroelectric layer enhance photovoltaic effect?

Bhatnagar's research group discovered that the photovoltaic effect is greatly enhanced if the ferroelectric layer alternates not only with one, but with two different paraelectric layers. Yeseul Yun, a PhD student at MLU and first author of the study, explains: "We embedded the barium titanate between strontium titanate and calcium titanate.

Can ultra-thin layers increase the photovoltaic effect of solar cells?

Combining ultra-thin layers of different materials can raise the photovoltaic effect of solar cells by a factor of 1,000, according to researchers at Martin Luther University Halle-Wittenberg (MLU) in Germany.

Can solar cells boost photovoltaic effect in ferroelectric-paraelectric superlattices?

"Solar cells: Boosting photovoltaic effect in ferroelectric-paraelectric superlattices." ScienceDaily. ScienceDaily, 20 July 2021. < / releases / 2021 / 07 / 210720114438.htm >.

Once the durability hurdles are overcome, perovskite solar cells could offer a cost-effective alternative to silicon, potentially transforming the capabilities of solar energy on a massive scale. In turn, this could foster future ...
