

Current status of wind power and photovoltaic power generation

Will solar and wind energy lead the growth in US power generation?

Solar and wind energy will lead the growth in U.S. power generation for at least the next two years, according to EIA estimates. This report uses data from the EIA to analyze solar and wind capacity and generation over the past decade (2014 to 2023) in all 50 states and the District of Columbia.

Are solar and wind the future of energy?

Solar and wind account for more of our nation's energy mix than ever before. To study America's growing renewable electricity capacity and generation, Climate Central analyzed historical data on solar and wind energy over a 10-year period (2014 to 2023).

How will solar PV & wind impact global electricity generation?

The share of solar PV and wind in global electricity generation is forecast to double to 25% in 2028 in our main case. This rapid expansion in the next five years will have implications for power systems worldwide.

Will wind and solar power capacity increase in China in 2023?

Renewable power capacity in China if wind and solar capacity additions continue at same rate as 2023 every year from 2024 to 2030 Source: China National Energy Administration What are the obstacles? demand region remains a challenge. Although there is fast growth in power storage renewables, casting a shadow on wind and solar's achievements.

Will solar and wind make up the majority of electricity capacity?

Projected solar and wind proportion of electricity capacity under current (optimistic) policy scenarios. Solar and wind (combined) are expected to make up a majority of electricity capacity in most U.S. states by 2035 under optimistic current policy scenarios.

Where do solar and wind power data come from?

All national and state-level data come from the U.S. Energy Information Administration (EIA). Utility-scale solar and wind summer capacity values for 2014-2022 are as reported in EIA's Historical State Data for each year.

In 2023, an estimated 96% of newly installed, utility-scale solar PV and onshore wind capacity had lower generation costs than new coal and natural gas plants. In addition, three-quarters of new wind and solar PV plants offered cheaper ...

In the United States, utility-scale solar capacity additions outpaced additions from other generation sources between January and August 2023--reaching almost 9 gigawatts (GW), up 36% for the same period in 2022--while small-scale solar ...
