Why is thermal management of battery energy storage important?

Dongwang Zhang and Xin Zhao contributed equally to this work. Battery energy storage system occupies most of the energy storage market due to its superior overall performance and engineering maturity, but its stability and efficiency are easily affected by heat generation problems, so it is important to design a suitable thermal management system.

How can a battery thermal management system improve its thermal performance?

The optimal design of the structure of the battery thermal management system can greatly improve its thermal performance. The purpose of this paper is to address situations where structural parameters may exist as discrete or continuous variables, and to provide a more comprehensive design approach for similar battery thermal management systems.

Do structural parameters affect the temperature of battery heat dissipation systems?

Schematic diagram of the range analysis process. The simulation of 36 groups of battery heat dissipation systems with different structural parameters was carried out according to the OT design table to research the influence of different structural parameters on the temperature of the battery heat dissipation system.

Can a battery energy-storage system improve airflow distribution?

Increased air residence time improves the uniformity of air distribution. Inspired by the ventilation system of data centers, we demonstrated a solution to improve the airflow distribution of a battery energy-storage system (BESS) that can significantly expedite the design and optimization iteration compared to the existing process.

What is a battery energy storage system?

Among ESS of various types, a battery energy storage system (BESS) stores the energy in an electrochemical form within the battery cells. The characteristics of rapid response and size-scaling flexibility enable a BESS to fulfill diverse applications.

Does air cooled battery thermal management reduce temperature difference?

The simulation results show that the average temperature difference of the battery was reduced by 14.03 %, and the temperature difference of the cooling channel was reduced by 46.41 %. In the same study, Zhang et al. [21] designed an air-cooled T-type battery thermal management system (T-BTMS).
