Distance between photovoltaic support columns

What rack configurations are used in photovoltaic plants?

The most used rack configurations in photovoltaic plants are the 2 V × 12 configuration(2 vertically modules in each row and 12 modules per row) and the 3 V × 8 configuration (3 vertically consecutive modules in each row and 8 modules per row). Codes and standards have been used for the structural analysis of these rack configurations.

Why is inter-row spacing important in photovoltaic systems?

Inter-row-spacing plays a significant role in the performance and economicsof photovoltaic (PV) systems. The performance and economics are expressed by the amount of the energy generated along the life time of the system and the payback time.

How to design a photovoltaic system?

This consists of the following steps: (i) Inter-row spacing design; (ii) Determination of operating periods of the P V system; (iii) Optimal number of solar trackers; and (iv) Determination of the effective annual incident energy on photovoltaic modules. A flowchart outlining the proposed methodology is shown in Fig. 2.

What are the design variables of a single-axis photovoltaic plant?

This paper presents an optimisation methodology that takes into account the most important design variables of single-axis photovoltaic plants, including irregular land shape, size and configuration of the mounting system, row spacing, and operating periods (for backtracking mode, limited range of motion, and normal tracking mode).

How to choose suitable locations for photovoltaic (P V) plants?

The selection of the most suitable locations for photovoltaic (P V) plants is a prior aim for the sector companies. Geographic information system (G I S)is a framework used for analysing the possibility of P V plants installation . With G I S tools the potential of solar power and the suitable locations for P V plants can be estimated.

How to optimize a photovoltaic plant?

The optimization process is considered to maximize the amount of energy absorbed by the photovoltaic plant using a packing algorithm(in Mathematica(TM) software). This packing algorithm calculates the shading between photovoltaic modules. This methodology can be applied to any photovoltaic plant.
