What is Microgrid Certification Training?

Microgrid Certification Training is a 3-day course designed for all engineers who want to learn, design, or operate microgrids. It is also suitable for power traders to understand modern microgrid technologies and independent system operator personnel. The training covers understanding energy management systems (EMS) in microgrids, including centralized or decentralized microgrids.

How do I select a qualified contractor for a microgrid system?

Generally, however, the goal of the processes is the same: to select a qualified contractor by reviewing several proposals from various contractors. The proposals should be from qualified contractors with experience in the design, construction, and commissioning of complex microgrid systems.

How much construction is required for a microgrid project?

The level of construction for a microgrid project will vary considerably depending on the amount of new infrastructure required. If a lot of new infrastructure such as generation equipment, communications lines, and electrical equipment is required, the construction process can be quite long and involved.

Do microgrid control systems need cybersecurity certification?

Cybersecurity is a critical consideration when evaluating communications systems and selecting a communications method. Microgrid control systems, which are categorized as industrial control systems, or ICS, require cybersecurity certification from the DoD (see Section 4.7).

What is a microgrid?

The DOE defines a microgrid as a group of interconnected loads and distributed energy resources (DERs) within clearly defined electrical boundaries that acts as a single controllable entity with respect to the power grid.

How much does a microgrid cost?

Microgrids are complex systems that require specialized skills to operate and maintain. Microgrids include controls and communication systems that contain cybersecurity risks. A 2018 study conducted by the National Renewable Energy Laboratory found that microgrids in the Continental U.S. cost an average of \$2 million-\$5 million per megawatt.
