

Energy storage system cost 1 5

What are base year costs for utility-scale battery energy storage systems?

Base year costs for utility-scale battery energy storage systems (BESSs) are based on a bottom-up cost model using the data and methodology for utility-scale BESS in (Ramasamy et al., 2023). The bottom-up BESS model accounts for major components, including the LIB pack, the inverter, and the balance of system (BOS) needed for the installation.

How much does a standalone energy storage system cost?

I was interested in the cost benchmark aspects of U.S. Li-ion standalone energy storage systems. NREL calculates that "For a standalone storage system, assuming a constant battery price of \$209 per kilowatt-hour (kWh), the installed system costs vary from \$380/kWh for a four-hour battery system to \$895/kWh for a 30-minute battery system."

How much does gravity based energy storage cost?

Looking at 100 MW systems, at a 2-hour duration, gravity-based energy storage is estimated to be over \$1,100/kWh but drops to approximately \$200/kWh at 100 hours. Li-ion LFP offers the lowest installed cost (\$/kWh) for battery systems across many of the power capacity and energy duration combinations.

What are the different types of energy storage costs?

The cost categories used in the report extend across all energy storage technologies to allow ease of data comparison. Direct costs correspond to equipment capital and installation, while indirect costs include EPC fee and project development, which include permitting, preliminary engineering design, and the owner's engineer and financing costs.

How much does a non-battery energy storage system cost?

Non-battery systems, on the other hand, range considerably more depending on duration. Looking at 100 MW systems, at a 2-hour duration, gravity-based energy storage is estimated to be over \$1,100/kWh but drops to approximately \$200/kWh at 100 hours.

How much energy does a brick-based storage system use?

For brick-based storage systems, cost and performance information was obtained for a single power output (10 MW) with two different energy outputs (40 and 2,40 MWh) (Terruzzin, 2021). From this information, costs were extrapolated for the various energy and power levels considered in this study by solving two linear equations.

Base year costs for utility-scale battery energy storage systems (BESS) are based on a bottom-up cost model using the data and methodology for utility-scale BESS in (Ramasamy et al., 2022). The bottom-up BESS model accounts for ...
