

Should floating PV systems be used for aquaculture?

The deployment of floating PV systems on water surfaces designated for aquaculture stands out as a tactic, amplifying land utilization efficiency, curtailing water evaporation, and delivering shading benefits to aquatic life, thereby amplifying the overall productivity of the system (Vo et al. 2021).

Does fishery complementary photovoltaic (FPV) power plant affect radiation and energy flux?

Meanwhile, the underlying surface of PV in land is significantly different from those in lake. The fishery complementary photovoltaic (FPV) power plant is a new type of using solar energy by PV power plant in China. The studies of the impact of FPV on the balance of both radiation and energy flux have been less presenting.

Does Floating photovoltaic (FPV) affect the aquatic environment?

With the aggravation of global warming and the increasing demand for energy, the development of renewable energy is imminent. Floating photovoltaic (FPV) is a new form of renewable energy generation. However, the impact of FPV on the aquatic environment is still unclear.

How FPV will affect the fishery and photovoltaics integration project?

With the increase of coverage ratio, FPV will lead to the overall reduction of T_w in the construction water area, and the distribution of T_w will be more uniform. For the "fishery and photovoltaics integration" project, reducing the peak T_w in summer and reducing the diurnal fluctuation are more conducive to the growth of fish.

How does Fishery and photovoltaics integration work?

However, in the "fishery and photovoltaics integration" project, a large amount of nitrogen, phosphorus and potassium are discharged into the water area, which will significantly increase the concentrations of nutrients and algae. In addition, significant biofouling is observed at the interface between the buoy and water (Fig. 5 c1-c2).

Are fishery complementary photovoltaic power plants a new surface type?

The deployment of photovoltaic arrays on the lake has formed a new underlying surface type. But the new underlying surface is different from the natural lake. The impact of fishery complementary photovoltaic (FPV) power plants on the radiation, energy flux, and driving force is unclear.

This publication examines the use of solar photovoltaic (PV) technology in aquaculture. It outlines key questions to keep in mind if you are considering solar arrays for a closed aquaculture system, and includes an example of a fish ...

Fish farming technology under photovoltaic panels
