

# Flexible photovoltaic support foundation construction

Why are flexible PV mounting systems important?

Traditional rigid photovoltaic (PV) support structures exhibit several limitations during operational deployment. Therefore, flexible PV mounting systems have been developed. These flexible PV supports, characterized by their heightened sensitivity to wind loading, necessitate a thorough analysis of their static and dynamic responses.

What is flexible PV technology?

Flexible PV technologies require highly functional materials, compatible processes, and suitable equipment. The highlighting features of flexible PV devices are their low weight and foldability. Appropriate materials as substrates are essential to realize flexible PV devices with stable and excellent performance.

Why do we need flexible PV support systems?

The traditional rigid PV support systems face several issues and limitations, such as the requirement for large land areas, which constrain their deployment and development, especially in eastern regions. In response to these challenges, flexible PV support systems have rapidly developed.

Do flexible PV support structures amplify oscillations?

The research explores the critical wind speeds relative to varying spans and prestress levels within the system. Modal analysis reveals that the flexible PV support structures do not experience resonant frequencies that could amplify oscillations. The analysis also provides insights into the mode shapes of these structures.

Do flexible PV support structures deflection more sensitive to fluctuating wind loads?

This suggests that the deflection of the flexible PV support structure is more sensitive to fluctuating wind loads compared to the axial force. Considering the safety of flexible PV support structures, it is reasonable to use the displacement wind-vibration coefficient rather than the load wind-vibration coefficient.

What is a flexible PV mounting structure?

**Flexible PV Mounting Structure Geometric Model** The constructed flexible PV support model consists of six spans, each with a span of 2 m. The spans are connected by struts, with the support cables having a height of 4.75 m, directly supporting the PV panels. The wind-resistant cables are 4 m high and are connected to the lower ends of the struts.

2.4 Offshore flexible photovoltaic foundation column model. Flexible PV mounts are made up of flexible cables (wire ropes or steel strands), steel columns, steel beams and diagonal cables or inclined steel columns to form the support ...
