

Why is Huawei fusion solar smart PV management system not working?

Huawei FusionSolar Smart PV Management System shows that the communication with the inverter is interrupted. The RS485 cables among inverters are loose or disconnected. The PV string is not properly connected, and the inverter has no DC input. The baud rate or RS485 address of the inverter is changed. The Smart Dongle is faulty.

What protocol does a Huawei inverter use?

As the Huawei inverter business continues to expand, more and more general and customized inverters use the ModBus protocol for communication. This document provides information about the ModBus protocol used in Huawei inverters, and can be used to regulate and restrict follow-up third-party integration R&D and customizations.

Why is my smart dongle not connected to Huawei fusion solar smart PV management system?

The devices connected to the Smart Dongle are not connected to the Huawei FusionSolar Smart PV Management System properly. Check whether the inverter software version meets the requirements. If not, upgrade the inverter to a specified version or later. Check that the RS485 communications cables are connected properly.

How does fusion solar inverter work?

The inverter connects to the FusionSolar Smart PV Management System through the 4G Smart Dongle. The inverter connects to a phone through a Smart USB-WLAN Adapter (shortened to WLAN module in this document), Bluetooth module, or a data cable. You can use the SUN2000 app to view the running information and set inverter parameters locally.

What causes a high voltage in a PV inverter?

Incorrect PV array configuration: Excessive PV arrays are configured in strings No. 1 and 2, causing the open-circuit voltage to be higher than the input voltage limit of the inverter. High DC Input Volt.

What is Modbus protocol in Huawei inverters?

This document provides information about the ModBus protocol used in Huawei inverters, and can be used to regulate and restrict follow-up third-party integration R&D and customizations. During master-slave communication, the party that initiates a communication request is referred to as the master node.
