

Installation of solar power generation equipment in mountainous areas

Can a solar tree be installed in a mountainous area?

The solar tree has not been popularized yet, so the forest-photovoltaic field has many problems to be solved and is only in its infancy. The solar tree installed in mountainous areas will have a higher fixed load (self-load of solar power system), wind load, and snow load than the flat fixed panel.

Should solar panels be installed on snow-covered mountains?

The placement of solar panels on snow-covered mountains can boost the production of electricity when it is most needed -- in the cold, dark winter. Solar-power systems have long been hampered by a seasonal problem: the panels produce more energy in summer than in winter, at least in the mid-latitudes, where much of the planet's population lives.

Can solar power be installed in high-altitude countries?

There are many high-altitude developing countries across the world with solar potential, Armenia and Serbia to name a couple. Yet, despite the clear skies and low temperatures in snowbound, hilly regions that may be conducive to solar photovoltaics, installation in these areas is no easy task.

Can solar power be installed in a snowbound area?

The state plans to set up a one-gigawatt solar power plant in the Spiti Valley, an area that typically sees more than 300 clear and sunny days in a year but remains snowbound for up to a third of the year. Installing solar power plants in snowbound areas offers an important avenue for reducing pollution and mitigating climate change.

Could a solar power plant be set up in Himachal Pradesh?

But Himachal Pradesh, a hilly state in northern India where snow and sun abound, is about to break new ground. The state plans to set up a one-gigawatt solar power plant in the Spiti Valley, an area that typically sees more than 300 clear and sunny days in a year but remains snowbound for up to a third of the year.

Does grading a solar site affect native species?

Solar sites in the Northeast, mountain states or hilly regions can undergo civil engineering to make level ground for mounting. Yet, grading land can alter rain runoff patterns on the site, possibly displacing native species and raising project costs. "You're never going to have a perfectly flat site, anyway."

In the high mountains, solar photovoltaic installations remain rare. Some of them allow supplying isolated areas. However, larger-scale projects are currently being developed. In the Vésubie valley (Alpes-Maritimes), for example, nearly ...
