

# Is it dangerous to plant medicinal herbs under photovoltaic panels

Can solar energy be used to produce medicinal herbs?

Mehta et al. (2017) analyzed the drying systems with the solar and open sun drying systems. The quality parameters of the various dried products like vitamins (A,C), polyphenol, and flavonoids were higher with the solar drying system. The application of solar energy in the herbal industry for the production of medicinal herbs is not yet realized.

Does a PV plant cause a fire?

Indeed, the plants proposed between the Pv panels produce little biomass and, therefore, in the event of accidental combustion, causes fires of lower-intensity than invasive nitrophilous flora (Andrews, 2009). 4.3. Environmental goals achieved in EU biodiversity strategy for 2030.

Do medicinal plants use solar drying?

Medicinal plants information and their usage in therapeutic purposes. Thin layer drying of leaves in solar drying is reviewed. Exergy analysis of the overall solar drying process is presented. Use of thermal energy storage in solar drying is reviewed and presented. Economic analysis for solar drying of herbs are assessed.

Can rotating PV panels reduce fire hazards caused by vegetation?

PV is a renewable and sustainable energy source that creates new conditions for vegetation. Vegetation can have adverse effects on PV panels by increasing fire hazards. Rotating PV panels are appropriate for vegetation fire control. PV-related fire hazards caused by vegetation can be reduced by proper management. 1. Introduction

Do solar photovoltaic panels promote vegetation recovery?

Liu Y, Zhang R, Huang Z, Cheng Z, Lopez-Vicente M, Ma X, et al. Solar photovoltaic panels significantly promote vegetation recovery by modifying the soil surface microhabitats in an arid sandy ecosystem. Land Degrad Dev. 2019;30:2177-86. Lovich JE, Ennen JR. Wildlife Conservation and Solar Energy Development in the Desert Southwest.

Which plant species pose a less fire hazard in a rotating PV panel?

The dominant plant species in the rotating PV panel area produce biomass that grows more slowly, remains alive for a relatively long time, and is consumed by herbivores. Therefore, biomass of these species poses less fire hazard. Based on Table 1 and Fig. 3, it is evident that the IB changes throughout the growing season.
