

# Is wind power generation really environmentally friendly Zhihu

Why is wind energy a good source of energy?

Wind energy is among the cleanest and cheapest sources of energy which helps fight global poverty and car emissions. An average wind turbine causes emission in the first few months during its allocation and launch. After that period wind turbines have close to zero emission level, incomparably to fossil fuels.

Is wind energy a green energy source?

The transition from fossil fuel to a green economy has led to the rise of renewable energy sources. Wind energy stands out because it is free, clean, inexhaustible, has the capacity to generate greater power, and has lower energy costs.

Is wind energy good or bad for the environment?

It is not free of problems (Union of Concerned Scientists 2009), although they are small when contrasted to those associated with other sources of energy (US Department of Interior 2011; Al Zohbi et al. 2015). The impacts of wind energy on the environment are frequently viewed as positive from local to worldwide scales.

Are wind turbines good for the environment?

Its mature technology and comparatively low cost make it promising as an important primary energy source in the future. However, there are potential environmental impacts due to the installation and operation of the wind turbines that cannot be ignored.

Can wind energy replace fossil fuels?

In short, with proper and supportive policies towards wind power and a good understanding of its environmental impact, wind energy can be a clean and sustainable source of energy that can successfully replace fossil fuels. The authors wish to acknowledge the ICEE of the University of Hong Kong for supporting this study. J. Xu, D.

Do wind turbines generate more energy than a wind power plant?

During this time, they generate 40 times more energy compared to the energy required for the production, operation and the disposal of a wind power plant. So-called upstream emissions, generated mostly through the production of carbon-intensive steel and cement, are included in the overall carbon balance of a wind turbine's life cycle.
