

Do interconnected autonomous microgrids trade energy?

Abstract: In this paper, we study the interactions among interconnected autonomous microgrids, and develop a joint energy trading and scheduling strategy. Each interconnected microgrid not only schedules its local power supply and demand, but also trades energy with other microgrids in a distribution network.

How do interconnected microgrids benefit from energy trading?

Since interconnected microgrids operate autonomously, they aim to optimize their own performance and expect to gain benefits through energy trading. We design an incentive mechanism using Nash bargaining theory to encourage proactive energy trading and fair benefit sharing.

Should a multi-energy microgrid be a direct trader?

In addition, although direct trading among multi-energy microgrids enjoys higher benefits, its self-sufficient ability is lower than the situation considering intermediary agent, which may help policymakers to predict the merits and demerits associated with different energy trading modes among multi-energy microgrids in a more accurate way. 1.

How can Community Microgrids benefit from a P2P energy trading model?

1. A hierarchical P2P energy trading model is proposed for community microgrids with the integration of energy management scheme to get more economic and technical benefits to all MG entities. 2.

What are the benefits of microgrid distribution system?

In the distribution system, all microgrid owners and other stakeholders are benefited by sharing the locally generated energy with the adjacent microgrid entities with the help of energy trading process.

What is a microgrid (MG)?

A microgrid (MG) is a combination of various distributed energy resources (DERs), battery energy storage systems, and flexible loads within an electrically bounded area [2, 3]. Hence, the MGs are also known as self-sufficient energy systems which can be connected or disconnected from the main power grid system based on the load requirement.

Grid trading is an automated currency trading strategy where an investor creates a so-called "price grid". The basic idea of the strategy is to repeatedly buy at the pre-specified price and then wait for the price to rise above that level and then ...
