How to achieve state of charge balancing in a dc microgrid?

For the distributed energy storage system (ESS) in a DC microgrid, the novel distributed control strategy based on multiagent control is designed to achieve state of charge (SOC) balancing. In the proposed scheme, the output current of the converter is not required, which is an attractive feature to avoid the measurement error.

How does a dc microgrid achieve SoC balancing?

The voltage loop stabilizes the bus voltage, and the current closed loop achieves SOC balancing through reasonable dynamic current distribution. For the distributed energy storage system (ESS) in a DC microgrid, the novel distributed control strategy based on multiagent control is designed to achieve state of charge (SOC) balancing.

Can a state-of-charge dynamic balancing control strategy be used in DC shipboard microgrid?

In this paper, a State-of-Charge (SoC) dynamic balancing control strategy considering system communication failure and energy storage capacity difference is proposed to reach the SoC balancing and proper current sharing for distributed energy storage units (DESUs) in DC shipboard microgrid.

How to achieve SoC balancing of ESS in DC microgrids?

Based on the mentioned analysis, a novel distributed control strategy based on multiagent system is designed to realize SOC balancing of the ESS in DC microgrids. In the proposed scheme, the system bus voltage is controlled by the voltage regulator and the current regulator is used to achieve SOC balancing by reasonable current sharing.

Why are DC microgrids growing in popularity?

Consequently, DC microgrids are growing in popularity [7,8]. In DC microgrids, energy storage systems (ESSs) are crucial for voltage stabilization, energy balancing, and efficiency optimization. ESSs are essential and irreplaceable for the stable and sustainable operation of the system, particularly for islanded DC microgrids [10].

What is a microgrid & how does it work?

The microgrid integrates distributed generation sources, energy storage system (ESS) and loads, which is an effective way to utilize renewable energy on-site and reduce carbon emissions.

A unified distributed control strategy for dc microgrid operating modes based on the novel integration of distributed controllers for energy balancing is proposed: 6.2.1 Centralized control and decentralized control. As to the microgrid control ...
