

How does a photovoltaic panel track the Sun?

In this study, the electromechanical control system of a photovoltaic (PV) panel tracking the sun on the axis it moves along according to its azimuthal angle was designed and implemented. In this...

Can a PLC controlled PV panel track the Sun along both axes?

In the present study, a PLC controlled PV panel system which could track the sun along both axes was designed and implemented. In the system, the slope angles of the sun were calculated in a 1-year time period, every month, day and at every hour in a day.

How a solar tracking system enlarges the output power of a photovoltaic panel?

A solar tracking system enlarges the output power of a photovoltaic panel by 39.27%. Four Light Dependent Resistors (LDRs) are used to detect the sun position in the sky, allowing the tracking system to follow it and make the solar radiation perpendicular on the photovoltaic panel surface. The proposed approach is compared to a fixed panel system in the study.

Can a programmable logic controller control a solar tracking surface?

The programming method of control with an open loop system is employed where the programmable logic controller is used to control the motion of the sun tracking surface. An experimental study was performed to investigate the effect of using two axes tracking on the solar energy collected.

Can high-bit analog modules be used in sun-tracking systems of PV panels?

The systems which were implemented in this study can easily be used in the sun-tracking systems of the PV panels. However, when it is considered to increase the sensitivity of the tracking system, it would be more feasible to use high-bit analog modules.

Does a dual axis tracking photovoltaic system increase electricity?

One such research project conducted and published in Turkey, draws a parallel between dual axis tracking and fixed systems, determining that there is a 30.79% increase in the electricity obtained from the dual axis tracking photovoltaic system compared to the fixed photovoltaic system.

It can control a sun tracker device with electrical motors drives and designed for flat-plate PV modules and arrays. 2-axis sun tracking can increase 40% the annual energy delivered by PV grid connected systems in South-European ...
