

Do energy storage systems achieve the expected peak-shaving and valley-filling effect?

Abstract: In order to make the energy storage system achieve the expected peak-shaving and valley-filling effect, an energy-storage peak-shaving scheduling strategy considering the improvement goal of peak-valley difference is proposed.

Can energy storage reduce peak load and Peak-Valley difference?

The allocation of energy storages can effectively decrease the peak load and peak-valley difference. As a flexible resource, energy storages can play an important role in the distribution network with a high proportion of integrated PVs .

How can centralised energy storage reduce peak-valley price arbitrage?

In addition to reducing the peak-valley difference of transformer stations, additional centralised energy storages will be allocated to realise peak-valley price arbitrage when the investment of centralised energy storage units is not less than 1400 yuan/kWh and no more than 1600 yuan/kWh.

What are the optimal energy storage configuration combinations?

The optimal energy storage configuration combinations under three preferences and seven combination scenarios were obtained by solving the influence of unit investment cost, power load, energy storage charging, discharging efficiency, and the proportion of installed RE capacity to the new power capacity of energy storage.
