

# Photovoltaic inverter grounding fuse

## Does a residential inverter have a GFDI fuse?

Residential inverters (Single Phase) do not have a GFDI fuse. If the inverter is displaying a ground fault error, follow the manufacturer's manual for troubleshooting. Do not drain capacitors or remove a GFDI fuse.

### Do solar inverters need a ground fault detection & interruption device?

Solar inverters must have a ground fault detection and interruption (GFDI) device to detect and stop ground faults. It can identify the ground fault, generate an error code, and shut down the inverter. The amount of current flowing through the ground fault required to trip the inverter's GFDI varies based on the inverter type.

## How can a DC inverter prevent a ground fault?

DC ground faults can be prevented using transformer-less (non-isolated) inverters, which 1) have sensitive electronics that can sense a fault as low as 300 mA and 2) do not have a grounded conductor, thus reducing the possibility of unintended current to ground.

## What is a DC ground fault in a PV system?

DC ground faults are the most common type of fault in PV systems and half go undetected. A DC ground fault is the undesirable condition of current flowing through the equipment grounding conductor in the circuits carrying DC power (before the inverter).

## How does a grounded PV system work?

In any ground-fault scenario on the DC side of a grounded PV system, ground-fault currents from any source (PV modules or batteries in stand-alone systems) must eventually flow through the DC system bonding jumper on their way from the energy source through the fault and back to the energy source.

## Does a photovoltaic system have a DC grounding system?

Photovoltaic systems having dc circuits and ac circuits with no direct connection between the dc grounded conductor and ac grounded conductor shall have a dc grounding system. The dc grounding system shall be bonded to the ac grounding system by one of the methods in (1),(2),or (3).

Isolated transformer-based inverters use a fuse as a GFDI. Some ground faults may not have enough current to blow the fuse and shut down the inverter. Non-isolated inverters without transformers use more sensitive GFDIs with a ...
