

Photovoltaic panels that absorb radio waves

Solar radiation is not emitted in a smooth continuum. Superheated atoms in the Sun, particularly Hydrogen and Helium, absorb radiation in distinct wavelengths. These absorption bands are visible as dips in the green line in the graph ...

Radio waves are exactly the opposite. The section we generally consider to be "light" lies between ultraviolet and infrared. ... is then placed in direct sunlight, and the particles that make up that sunlight, photons of light, travel into the solar ...
