

Photovoltaic power station bracket installation sample drawing

How do I design a photovoltaic and solar hot water system?

Provide an architectural drawing and riser diagram for the homeowner showing the planned location for future photovoltaic and solar hot water system components. Space requirements and layout for photovoltaic and solar water heating system components should be taken into account early in the design process.

What drawings are required for the solar array and substation?

Detailed drawings for the solar array and substation will be required. The first semester will focus on the solar generation schematics and one-line drawings for the substation. During the second semester the team will begin detailed three-line drawings for the substation. First and second semester engineering schedule is laid out in figure 1.

Do I need to meter a photovoltaic system?

It is assumed that aluminum framed photovoltaic (PV) panels mounted on a "post" and rail mounting system, the most common in the industry today, will be installed by the homeowner. While metering the system is encouraged, the specification does not address system wiring elements for associated system sensors or monitoring equipment.

What types of mounting systems can be used for PV power plants?

There are several different types of mounting systems that can be used for PV power plants, such as fixed-tilt support structures, single- or double-axis tracking structures, marine-grade support structures that prevent corrosion, and so forth.

How does a photovoltaic system work?

The heart of a photovoltaic system is the solar module. Many photovoltaic cells are wired together by the manufacturer to produce a solar module. When installed at a site, solar modules are wired together in series to form strings. Strings of modules are connected in parallel to form an array.

What are the benefits of a pole-mounted PV array?

Tracking- Pole-mounted PV arrays can incorporate tracking devices that allow the array to automatically follow the sun. Tracked PV arrays can increase the system's daily energy output by 25 percent to 40 percent. Despite the increased power output, tracking systems usually are not justified by the increased cost and complexity of the system.
