

Proportion of wind power in power generation

What percentage of electricity is generated by wind turbines?

In 2022, wind turbines were the source of about 10.3% of total U.S. utility-scale electricity generation. Utility scale includes facilities with at least one megawatt (1,000 kilowatts) of electricity generation capacity. Last updated: December 27, 2023, with data from the Electric Power Monthly, December 2023.

What percentage of electricity is produced by wind?

Wind accounts for around 12% of the nation's capacity from all utility-scale electricity sources (including renewables and fossil fuels such as coal, oil, and natural gas). In 2023, around 10% of electricity in the U.S. was produced by wind. A decade earlier in 2014, wind accounted for 4% of the total electricity generated.

How many wind turbines are there in America?

Today more than 72,000 wind turbines across the country are generating clean, reliable power. Wind power capacity totals 151 GW, making it the fourth-largest source of electricity generation capacity in the country. This is enough wind power to serve the equivalent of 46 million American homes.

How much wind power does the United States have?

Wind power capacity totals 151 GW, making it the fourth-largest source of electricity generation capacity in the country. This is enough wind power to serve the equivalent of 46 million American homes. The industry achieved record-setting installations last year, with solar and storage paving the way to historic levels of clean power.

How many kilowatthours do wind turbines generate a year?

Total annual U.S. electricity generation from wind energy increased from about 6 billion kilowatthours (kWh) in 2000 to about 434 billion kWh in 2022. In 2022, wind turbines were the source of about 10.3% of total U.S. utility-scale electricity generation.

How many GW of wind power are there in 2022?

The worldwide total cumulative installed electricity generation capacity from wind power has increased rapidly since the start of the third millennium, and as of the end of 2022, it amounts to almost 900 GW.

In 2019, zero-carbon electricity production overtook fossil fuels for the first time, while on 17 August renewable generation hit the highest share ever at 85.1% (wind 39%, solar 25%, nuclear 20% and hydro 1%). In 2023, individual ...
