

Research on PCS topology of large-capacity battery energy storage system

What is a large-scale battery energy storage system (BESS)?

Large-scale battery energy storage system (BESS) can effectively compensate the power fluctuations resulting from the grid connections of wind and PV generations which are random and intermittent in nature, and improve the grid friendliness for wind and PV generation grid integration.

Why is energy storage technology important in China?

Energy storage technology has become critical for supporting China's large-scale access to renewable energy. As the interface between the battery energy storage system (BESS) and power grid, the stability of the PCS (power conversion system) plays an essential role.

Does China have a large-scale battery energy storage system?

In this paper, the system configuration of China's national demonstration project which has mixed various generations, such as wind, PV, and BESS together with a power transmission system is introduced, and the key technologies and operation status of large-scale battery energy storage system have been presented.

What is a reconfigurable topology of a battery?

Literature first proposed the reconfigurable topology of the battery, in which the system reconfiguration could be achieved through five control switches per cell. In the series topology, each battery cell had only two controllable switches, which were used to connect other cells in series or bypass.

What is the composition of energy storage system?

2. Energy storage system model The composition of energy storage system generally includes battery (mainly lithium battery), battery management system (BMS), battery management system (BMS), energy storage converter (PCS), energy management system (EMS) and other electrical equipment composition.

Are battery energy storage systems a security and economic problem?

Abstract: Battery energy storage systems (BESSs) are one of the main countermeasures to promote the accommodation and utilization of large-scale grid-connected renewable energy sources. With the rapid increase in the installed capacity of BESSs, the security problem and economic problem of BESSs are gradually exposed.

PCS can work in the following two states and shoulders two important functions: Rectifier working state: When charging the battery cells of the energy storage system, the alternating current of the grid is converted into direct current. ...
