

# Solar panels are not connected to load

What happens if a solar panel has no load?

A solar panel with no load isn't connected to any devices. When not connected to a device, a solar panel will still absorb sunlight but won't have anywhere for the energy to go. It has voltage, but no current is flowing. Because the voltage has nowhere to go, it will become heat in the solar cells and radiate from the panel until it dissipates.

What happens if a solar panel is not connected?

It has voltage, but no current is flowing. Because the voltage has nowhere to go, it will become heat in the solar cells and radiate from the panel until it dissipates. The battery will remain full until the load is reconnected, but not using the panels for extended periods while allowing them to remain in the sun could damage your system.

Can a battery power a solar panel without a connection?

A fully charged battery - the Vmaxtanks 125ah AGM is a good example - can power several appliances and devices, but it must be connected to a load. Without any connection it is just potential energy. The same thing can be said for solar panels. Is it OK to Leave a Solar Panel Disconnected?

Can a solar panel charge without a load?

A solar PV system that isn't connected to a load will remain in an open circuit condition. That's another saying that it will absorb the sun but have nowhere to send the power. As discussed above, this is fine for short periods but can cause damage if done continuously. Can Solar Panels Charge With Indirect Sunlight?

Can you leave solar panels in the sun without a CC?

There are LOTS of rumors out there. One I've heard recently is that you can't leave solar panels in the sun without them connected to a CC or some load. The rumor is that it will damage the panels since the power "has nowhere to go." I have a neighbor out here that is just terrified of having sun on their panels while disconnected from the CC.

What happens if two solar panels are connected together?

It becomes heat energy in the panel which is ultimately radiated or conducted away. If you were to take two identical panels, one connected to a load and the other one not and place them next to each other, the disconnected panel would be hotter than the connected one.

One I've heard recently is that you can't leave solar panels in the sun without them connected to a CC or some load. The rumor is that it will damage the panels since the power "has nowhere to go." I have a neighbor out here that is just ...
