

Solar power generation chart

What percentage of electricity is generated by solar?

Renewables as a whole contributed 38% of overall electricity generation (according to Ember Climate), and solar accounted for 11.5% of total renewables (see below). This gives an overall figure of 4.37%. In the US alone, the figure is slightly lower. The latest data shows solar producing 3% of total US electricity in 2020.

How much solar energy does the world use?

The world currently has a cumulative solar energy capacity of 850.2 GW (gigawatts). 4.4% of our global energy comes from solar power. China generates more solar energy than any other country, with a current capacity of 308.5 GW. The US relies on solar for 3.9% of its energy, although this share is increasing rapidly every year.

How much solar energy will be generated in 2030?

Reaching an annual solar PV generation level of approximately 8300 TWh in 2030, in alignment with the Net Zero Scenario, up from the current 1300 TWh, will require annual average generation growth of around 26% during 2023-2030.

How many terawatts does solar power produce in 2023?

In 2023, net solar power generation in the United States reached its highest point yet at 164.5 terawatt hours of solar thermal and photovoltaic (PV) power. Solar power generation has increased drastically over the past two decades, especially since 2011, when it hovered just below two terawatt hours.

How many people are employed in solar energy?

3,975,096 people are employed in the solar industry worldwide, and 263,883 of these are in the United States. The solar energy industry created more new jobs in the US than any other energy subsector last year. It would take around 18.5 billion solar panels to produce enough energy to power the entire US. What is the capacity of solar energy?

How many GW of solar PV will be installed in 2030?

Continuous support for all PV segments will be needed for annual solar PV capacity additions to increase to about 800 GW, in order to reach the more than 6000 GW of total installed capacity in 2030 envisaged in the NZE Scenario. Distributed and utility-scale PV need to be developed in parallel, depending on each country's potential and needs.
