

Solar power generation sales targets

Will solar and wind energy lead the growth in US power generation?

Solar and wind energy will lead the growth in U.S. power generation for at least the next two years, according to EIA estimates. This report uses data from the EIA to analyze solar and wind capacity and generation over the past decade (2014 to 2023) in all 50 states and the District of Columbia.

How many terawatts of solar power will the US generate?

Almost 1 terawatt of new solar and wind capacity will connect to the US power grid between 2024 and 2035, BNEF forecasts. Even accounting for planned power plant retirements, this will drive an 80% increase in the nameplate power generation capacity of the US by 2035.

When will solar power become a global trend?

New solar capacity added between now and 2030 will account for 80% of the growth in renewable power globally by the end of this decade. Adoption accelerates due to declining costs, shorter permitting timelines and widespread social acceptance.

Is China accelerating the growth of solar power in 2023?

While the increases in renewable capacity in Europe, the United States and Brazil hit all-time highs, China's acceleration was extraordinary. In 2023, China commissioned as much solar PV as the entire world did in 2022, while its wind additions also grew by 66% year-on-year.

Will solar power increase in 2020?

This reduction in cost in combination with solar policy incentives has led to rapid growth in solar photovoltaic (PV) generation capacity, from providing less than 0.1% of the U.S. electricity supply in 2011 to over 3% in 2020. This upward trajectory is expected to continue.

How much solar power will the US have by 2040?

The total US solar fleet is expected to nearly quadruple from 177 GWdc installed at year-end 2023, to 673 GWdc installed by 2034. By 2040, solar is expected to make up the largest share of electric generating capacity in the US. In this report, we have also included our alternative scenarios (a Bull case and a Bear case).

Solar accounted for 53% of all new electricity-generating capacity added to the US grid in 2023, making up over half of new generating capacity for the first time. The residential segment set another annual record at 6.8 GWdc ...

In 2023, an estimated 96% of newly installed, utility-scale solar PV and onshore wind capacity had lower generation costs than new coal and natural gas plants. In addition, three-quarters of new wind and solar PV plants offered cheaper ...
