

The color difference of photovoltaic panels indicates poor quality

What color are solar panels?

As you may have noticed, the majority of solar panels are a dark blue or black color. Monocrystalline solar cells are mostly black, gray, or blue, while polycrystalline solar cells are almost always blue. The blue or black coloration reflects as little light as possible, something that takes priority when attempting to maximize power output.

Can a colored PV panel be reflected or absorbed?

"When we want a colored PV panel, we have to accept that not all the visible solar spectrum will be transmitted to the cell, but part of it will be reflected or absorbed," he stated.

What affects the color of solar panels?

Something else that impacts the color of solar panels is the thickness of the anti-reflection coating applied to each panel. This thin film deters light from reflecting off the panel's glass and instead helps it absorb into the panel and produce more solar energy.

Will changing the color of solar panels reduce energy production?

However, as solar panels have become more popular and the market has expanded, more consumer demand for other colors appeals to building aesthetics. Initially, researchers and scientists thought changing the color of solar panel cells would amount to a 40% to 50% reduction in energy production.

How does color affect the performance of a PV panel?

The way a color is obtained, and how it affects the performance of a PV panel, therefore strongly depends on the specific technology used and the optical phenomena taking place. "Ideally, a colored PV panel should be able to reflect only a narrow band of the visible spectrum and transmit all the rest," Valckenborg explained.

Are color solar panels better than conventional solar panels?

Just a few years ago, it was thought that power yield could be up to 50% lower than conventional panels, but tests have shown a difference of just 10%. Valckenborg says that losses can vary depending on the color of a panel. Colored modules being tested at the SolarBEAT test field.
