

# The photovoltaic panels do not indicate the manufacturer

Does a roof support solar photovoltaic panels or modules?

The structure of a roof that supports solar photovoltaic panels or modules shall be designed to accommodate the full solar photovoltaic panels or modules and ballast dead load, including concentrated loads from support frames in combination with the loads from Section CS507.1.1.1 (IBC 1607.13.5.1) and other applicable loads.

What conditions should a roof support a photovoltaic panel system?

Roof structures that support photovoltaic panel systems shall be designed to resist each of the following conditions: 1. Applicable uniform and concentrated roof loads with the photovoltaic panel system dead loads.

Are all solar module production lines created equal?

Not all solar module production lines are created equal. A poor production line may accidentally laminate cracked solar cells into solar panels and introduce a mismatch to cells that impact power production. Chipped solar cells reduce energy production of a solar module.

Can a roof deck support a photovoltaic panel system?

Structures with open grid framing and without a roof deck or sheathing supporting photovoltaic panel systems shall be designed to support the uniform and concentrated roof live loads specified in Section CS507.1.1.1 (IBC 1607.13.5.1), except that the uniform roof live load shall be permitted to be reduced to 12 psf (0.57 kN/m<sup>2</sup>).

What are the NFPA requirements for solar PV systems?

The electrical portion of solar PV systems shall be installed in accordance with NFPA 70. CS512.2 (IFC 1204.2) Access and pathways. Roof access, pathways, and spacing requirements shall be provided in accordance with Sections CS512.2.1 (IFC 1204.2.1) through CS512.3.3 (IFC 1204.3.3).

Are solar panels required for a roof photovoltaic live load?

Solar photovoltaic panels or modules that are independent structures and do not have accessible/occupied space underneath are not required to accommodate a roof photovoltaic live load, provided the area under the structure is restricted to keep the public away.

As established above, these standards indicate the solar panel has been tested for hail impact and can withstand between one inch to three inches of hailstone ice balls traveling at 16.8 mph to 88.3 mph. Knowing your solar panel passed ...

If your solar system has performance monitoring (more on that later) and you do not notice a decrease in efficiency, you do not need to clean the panels. For those that do find their panels require cleaning in order to maintain ...
