

UHV microgrid and backbone network

Why do UHV networks have a long distance transmission capacity?

As the clean energy resources such as hydro energy, wind energy and solar energy are often far away from the load center, of the longer distance transmission capability of UHV networks can promote the development of the distributed energy resources. Table 1. Transmission capacity and transmission distance for each voltage class a.

How effective are UHV transmission lines?

UHV transmission lines feature high transmission efficiency, long transmission distance, low line loss, and flexible power deployment. These characteristics make them effective in overcoming the market segmentation of the power supply caused by the imbalance of China's regional energy resource endowment.

Where does the UHV transmission network work?

Currently, the UHV transmission network has connected resource-rich regions in western China, such as Xinjiang, Shanxi, and Inner Mongolia, and energy-deficient regions in central and eastern China, such as Zhejiang, Jiangsu, and Hunan. The transmission end is mainly thermal power generation, hydropower generation, and wind power generation.

Why are UHV and smart grid domains becoming inevitable?

Developments in UHV and smart grid domains became inevitable because global energy interconnection (GEI) will be built up to link clean energy bases such as wind farms in the arctic and solar farms in the equatorial regions where the potential are relatively higher than other places in the world.

What is the future development of UHV transmission technology?

The future development of UHV transmission technology will be characterised by more economic, more reliable, and more environment-friendly. The power demand increases rapidly in China; however, the areas of huge power demands are of long distance from most areas of abundant energy resource in the country. Therefore, China put in great ef...

Do UHV transmission projects improve regional environmental performance?

This finding means that the operation of UHV transmission projects has enhanced the power generation capacity, and a sufficient supply of electricity is conducive to the realization of "replacing coal with electricity", thus improving regional environmental performance.
