

# What are the blue spots on photovoltaic panels

What causes hot spots on solar panels?

Hot spots, one of the most common issues with solar systems, occur when areas on a solar panel become overloaded and reach high temperatures relative to the rest of the panel. When current flows through solar cells, any resistance within the cells converts this current into heat losses.

How do you identify hot spots on solar panels?

To identify hot spots, you can use thermal imaging cameras or consult a solar professional who has the necessary equipment to conduct a comprehensive inspection. Potential-Induced Degradation, or PID, is a phenomenon that affects the performance of solar panels.

Can discoloration damage a solar panel?

In some cases, severe discoloration could potentially indicate damage, although the presence of discoloration does not necessarily imply a solar panel defect. The most common defects in solar panels include issues such as hot spots, snail trails, and imperfections in the materials.

How do I know if my solar panels are delaminated?

If you see dark spots on your panels, this could be a sign that your panels are undergoing delamination, and you should contact your installer for an inspection. Micro cracks are tiny tears in solar cells stemming from haphazard shipping and installation or defects in manufacturing.

What is a hot spot in a PV module?

In a photovoltaic (PV) module, a hot spot describes an overproportional heating of a single solar cell or a cell part compared to the surrounding cells. It is a typical degradation mode in PV modules. Hot spots can originate, if one solar cell, or just a part of it, produces less current compared to the other cells connected in series.

How do you know if a solar panel is faulty?

One of the most evident signs of a faulty solar panel is a noticeable decrease in energy production. If your solar system is generating significantly less electricity than it used to, it could indicate a problem with one or more panels.
