

# What happens if the photovoltaic panel voltage is too high

Why do solar panels have a higher voltage?

The number of solar cells in series affects the voltage output. So more cells in a panel means more voltage for your solar system. Sunlight is key! Sunlight intensity and angle play a role in the maximum power point (MPP) voltage of your solar panel. More sunlight, better angles, and more voltage.

Why do solar panels have a higher power rating?

The higher the rating, the more power you get from your panels. Size matters! The number of solar cells in series affects the voltage output. So more cells in a panel means more voltage for your solar system. Sunlight is key! Sunlight intensity and angle play a role in the maximum power point (MPP) voltage of your solar panel.

Does solar panel temperature affect voltage?

Panel temperature will affect voltage- as has been discussed in another blog. Have a look at these I-V (Current vs Voltage) and P-V (Power vs Voltage) charts for a 305W solar panel from Trina Solar. You can see in the P-V curve that as the solar radiation decreases from 1000W/m<sup>2</sup> to 200W/m<sup>2</sup>, the power drops proportionally - from 300W to 60W.

What happens if grid voltage is higher than solar power?

Electricity flows from higher voltage to lower voltage. This means if the grid voltage is higher than the voltage produced by rooftop solar, that solar power system will be unable to export energy.

What causes overvoltage in solar panels?

Overvoltage is one of the most common issues that impact your panels' performance, it happens when the grid voltage exceeds 258 volts and it when more solar is generated than power being used. When the voltage gets to 253 volts it becomes too high for solar AC to reach the grid, this may result in lost feed-in tariff for your home.

What if my solar power is too high?

Increasing the voltage allowance on the grid to handle the higher voltage that solar is creating. Your local distribution network service provider (DNSP) ours is SA Power Networks, legally have to fix the voltage if it's higher than the standard range (mentioned above).

The operating point (I, V) corresponds to a point on the power-voltage (P-V) curve, For generating the highest power output at a given irradiance and temperature, the operating point should such correspond to the maximum of ...
