

What is windographer by UL solutions?

Our industry-leading software enables you to import, analyze and visualize wind resource data quicker and easier than ever before. Import, analyze and visualize wind data quickly and easily with Windographer by UL Solutions. Our industry-leading software can process wind resource data measured by met tower, lidar or sodar.

What is MATLAB based postprocessor for wind turbine data analysis?

(pronounced "jeep") is a general-purpose postprocessor for wind turbine data analysis. is a set of MATLAB scripts that performs multi-blade coordinate (MBC) transformation on wind turbine system models. is a MATLAB-based postprocessor for wind turbine data analysis.

What types of wind energy projects can I model with WindPRO?

With windPRO, you can model all kinds of wind energy projects. From the simplest single turbine project, to large-scale multi-mast, multi-turbine, multi-neighbor projects. Select the right wind turbine model by utilizing the catalogue of over 1,000 models approved by manufacturers. The cost of energy relies heavily on the available wind resource.

What makes a wind data import software unique?

This software is unique because it has the ability quickly to import data from a variety of different formats allowing for rapid quality control and statistical analyses, including measure-correlate-predict (MCP), and the functionality to export data to almost any wind flow model that is commonly used within the wind power industry.

How can system planners represent wind turbine generator?

System planners can represent wind turbine generator as a single machine mathematical model of the entire wind farm to understand the impact of wind penetration in the grid under variability of wind.

What is a wind turbine simulation code?

is an open-source suite of codes designed for multi-fidelity simulation of wind turbines and wind farms, including high-fidelity simulations that resolve scales going from micron-scale boundary layers around turbine blades up to kilometer-scale turbulent atmospheric flow. Also included are the capability to run actuator-line and -disk simulations.

ETAP Wind Turbine Generator can be used to verify grid connection compliance, steady-state and dynamic simulation of whole wind parks, size collector systems, calculate short circuit current levels, analyzing alternative turbine placement, ...
